Soundstop® 10mm plasterboard is specifically developed for use in acoustic systems to control the amount of noise transfer between rooms in residential construction. Soundstop® 10mm plasterboard is used in high-performance USG Boral acoustic wall and ceiling systems not requiring fire-rating properties such as QuietZone®, CinemaZone® and other proprietary systems where reducing sound transfer from one room to another is required.

It is also used in fire rated systems, such as Partiwall®, to satisfy the relevant acoustic provisions of the Building Code of Australia (BCA).

**ADVANTAGES**
- High acoustic performance
- Reduces sound transfer
- Internal wall and ceiling systems application

**PERFORMANCE DETAILS**

**ACOUSTIC**

Soundstop®, when used in an acoustic system can provide required levels of sound insulation to achieve specified acoustic ratings.

**AIRBORNE NOISE**

WEIGHTED SOUND REDUCTION INDEX ($R_w$)

Noise sources such as voices, television sets/home theatre and musical instruments, generate sound in the air in one room and this sound passes through the partition and into the room on the other side. This is known as airborne noise.

</table>
The Building Code of Australia (BCA) has adopted the Weighted Sound Reduction Index ($R_w$) as a measure of sound isolating properties of building elements. A partition with a high $R_w$ rating isolates sound better than a partition with a low $R_w$ rating. If two partitions are compared subjectively and one has an $R_w$ which is 10 rating points higher, then the noise passing through the better wall will be about half the loudness of the lesser wall. The $R_w$ ratings are obtained from tests carried out in certified laboratories, under controlled conditions.

**SPECTRUM ADAPTATION TERM ($C_{tr}$)**

The $R_w$ alone is not a good indicator of how well the partition isolates low frequency (bass) sounds. To improve the low frequency performance of wall and ceiling partitions, the BCA requires specific walls to meet an $R_w + C_{tr}$ criterion. When the $C_{tr}$ is combined with the $R_w$, the result is a single number index which provides a more reliable indicator of the ability of the partition to isolate noise containing low frequency components. The higher the $R_w + C_{tr}$ value for a wall or ceiling partition the better the sound insulation performance, particularly in the low frequencies.

Determination of $R_w$ is defined in AS/NZS ISO 717-1 Acoustics – Rating of sound insulation in buildings and of building elements Part 1: Airborne sound insulation.

There are two types of noise transfer through partitions, airborne transfer, and structure borne transfer. Both may need to be considered in order to achieve the desired result.

---

**INSTALLATION**

Refer to USG Boral website [www.usgboral.com/plasterboard](http://www.usgboral.com/plasterboard) or call TecASSIST® on 1800 811 222.

**SUSTAINABILITY**

USG Boral products are manufactured from a combination of natural gypsum, and paper liner made from 100% reclaimed and recycled paper waste. Plasterboard waste can be reclaimed and recycled into new plasterboard.

Lightweight plasterboard construction offers the benefits of low embodied energy, non-toxic materials, enhanced indoor air quality, and ease of thermal and acoustic upgrading.

**MANAGEMENT (MAN)**

**WASTE MANAGEMENT**

Waste collection services are available to divert acceptable plasterboard waste away from land fill for recycling or re-processing for other uses. For information on waste collection services available, please contact your local USG Boral office.

**INDOOR ENVIRONMENT QUALITY (IEQ)**

**INTERNAL NOISE LEVELS**

Soundstop®, when used in an acoustic system, can assist in controlling noise levels and occupant comfort through the attenuation of noise transmissions.

**INDOOR ENVIRONMENT QUALITY (IEQ)**

**VOLATILE ORGANIC COMPOUNDS (VOC) AND FORMALDEHYDE MINIMISATION**

USG Boral products, compounds and adhesives have been independently tested to confirm compliance with Green Star specification limits for VOCs and are formaldehyde free.
